

HOW WOULD YOUR BUSINESS MANAGE WITHOUT ITS KEYS?

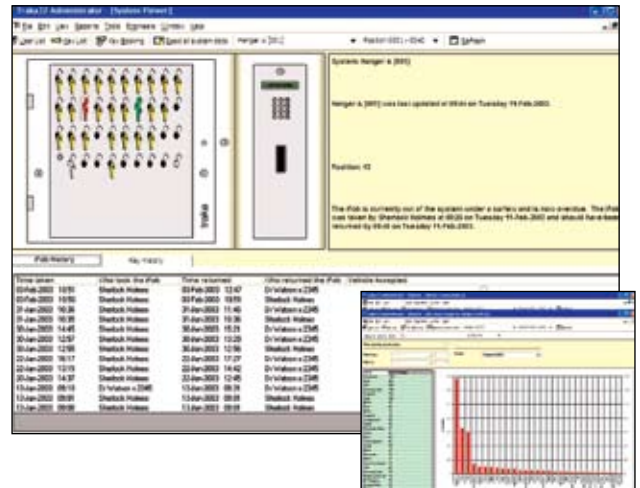

The keys to your business are one of its most important assets. Without access to keys you can't access your business. Keys access your doors, filing cabinets, lockers and vehicles. Keys may even give access to your customers' buildings or vehicles.

How do you look after them? Do you know whose using them?

Traka electronic key management systems provide the perfect solution. Simply attach your keys to the Traka iFobs using our special security seals and return them to the Traka cabinet. From now on Traka will ensure that only authorised staff are allowed the keys and that every key taken will be recorded automatically showing user name, date and time.

The iFobs can actually lock into place, so not only does Traka control who has access to the cabinet but also which specific key a user is allowed to take.

Access to Traka is by PIN, card or biometrics and we can even offer you compatibility with existing access cards

making Traka into an effective extension of your current access control system. No wonder Traka offers total access management.

Finding who has the key is simply a matter of enquiring at the keypad. More importantly Traka holds the information in the special Traka32 Windows software allowing long-term records to be maintained so you will always know who used the key at any time in the past.

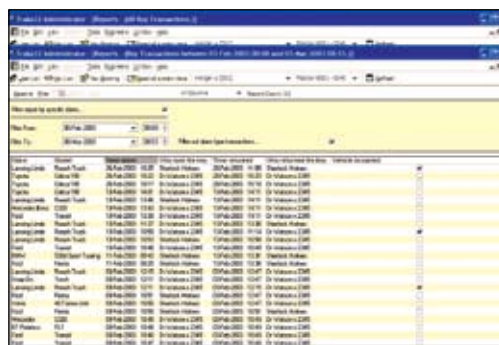

You will also know how often the keys were used and for how long. In turn this gives you important information about the assets of your business, perhaps the total time a vehicle was used for or how frequently the lift motor room was accessed for maintenance. Keys are not just there for security. They are often for control, perhaps to prevent untrained staff from using dangerous equipment and in today's ever more controlled society, health and safety issues are of increased importance.

Traka systems are tried and tested and in use 24 hours a day throughout the world. They are used by some of the largest corporations, at government and military sites, in correctional 

institutions, in hotels, hospitals, motor dealers, amusement parks, casinos and almost every type of organisation you can imagine.

Traka fully recognise that the monitoring and management of the asset controlled by the key is the reason Traka cabinets are so successful. Features such as fault logging allowing problems detected during the use of the asset to be recorded, key curfews which alarm when keys are not returned on time, key booking which allows keys to be reserved and mileage logging requesting a vehicles mileage to be recorded when the keys are returned are just some of the quite unique features available with Traka.

The Traka32 software is fully Microsoft based ensuring corporate acceptability allowing even the largest businesses to run Traka software over their networks. As new features become available Traka can be upgraded, simply and easily – even remotely if required.

Traka PostBox provides a unique simple way of ensuring that your existing corporate staff database updates Traka with staff changes actually as they happen allowing a fully automatic synchronisation of Traka records with your personnel records so as staff leave or join you will know that access to the keys is allowed or prohibited.

Traka can even be integrated into your own access control system, ensuring keys are returned before staff leave the building. Controlling keys is one thing, so too is making sure that the keys are available when needed, so only the highest quality components are used by Traka.

Examples are the metal iFobs, which are not just strong, but also self-cleaning requiring no essential maintenance, the ultra reliable power supplies and solenoids with incredibly low failure rates.

Traka systems are also modular with a range of base sizes to suit every business need. Simply select the cabinet and then specify the number of key positions to be included. You can even easily expand later by adding more key positions or extension cabinets.

Traka cabinets are provided as standard with clear, strong polycarbonate doors allowing you to see if the keys have been returned and the fixed key location allows you to easily identify those that haven't.

But if you wish to have a solid metal door or even no door, Traka will be pleased to meet your demands.

Traka have their own fully trained installation team and project managers to help you get up and running in the least time, so that you can quickly start to take advantage of this remarkable UK designed and manufactured product.

TRAKA PRODUCTS

Traka M series	10-20 keys
Traka S Series	10-60 keys
Traka L Series	10-180 keys
Traka32	Software with Access or SQL Server database for full networking
Traka Immobilisor	The Intelligent Key
